# turn your evaluation metric into a function
# here's one for correlating annual minimum flow
source("check minannual.R")
check_minannual(m=sager$model,o=sager$obs, month=sager$month, day=sager$day, year=sager$year, wy=sager$
## [1] 0.8101656
Peformance evaluation may depend on what parameter set you use
Calibration is picking parameter sets based on performance evaluation
Apply metrics over multiple outputs (generated by running across many parameters sets) - like we've done
in our sensitivity analysis work
# multiple results - lets say we've run the model for multiple years, each column
# is streamflow for a different parameter set
msage = read.table("sagerm.txt", header=T)
# lets say we know the start date from our earlier output
msage$date = sager$date
```

head(msage)
